# Equational theories of algebraic operators on Weihrauch problems

Cécilia Pradic

 $\supseteq$  <u>lies</u> and *revisionism* and j.w.w. Eike Neumann, Arno Pauly & Ian Price Dagstuhl meeting 25141

## Setting for the motivation

## Type 2 computability

Turing Machines with

- Input tape containing some  $i \in 2^{\omega}$
- Write-and-go-right-only-output tape
- Natural setting to compute with infinite objects

(the "real"  $2^{\omega}$  is representable)

### The category of represented spaces ReprSp

- Objects:  $(X, \delta_X)$  where  $\delta_X$  is a **partial** surjection  $2^{\omega} \twoheadrightarrow X$
- Morphisms: maps  $X \to X'$  with a type 2-computable witness
- Super nice: extensive, lcc, W/M-types
- ( $\cong$  subcategory of the modest sets in the Kleene-Vesley topos)

# Weihrauch problems

## <u>Definition</u> of Weihrauch problems as *containers*

A Weihrauch problem P is an internal family in ReprSp, i.e.

$$P: \operatorname{positions}(P) \to \operatorname{shape}(P)$$

- shape(P) is the space of **questions**
- positions(P) is the space of **answers**
- P links answers with the questions they are answering
- Notation:  $P_i = P^{-1}(i)$

#### Examples:

- $\mathsf{C}_{\mathbb{N}}$ : "Given  $p \in \mathbb{N}^{\mathbb{N}}$ , find something not enumerated by p"  $\{(p,n) \in \mathbb{N}^{\mathbb{N}} \times \mathbb{N} \mid n \notin \mathsf{range}(p)\} = \mathsf{positions}(\mathsf{C}_{\mathbb{N}}) \xrightarrow{\pi_1} \mathsf{shape}(\mathsf{C}_{\mathbb{N}}) \subseteq \mathbb{N}^{\mathbb{N}}$ 
  - $\bullet$  WKL0: "given an infinite binary tree, produce an infinite path"

## Weihrauch reducibility

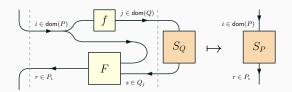

TL;DR: Turing reducibility, but

- adapted to type 2 computability
- reductions must make **exactly** one oracle call

#### Official definition

 $P \leq_{\mathbf{W}} Q$  if there are **computable** 

$$f: \operatorname{shape}(P) \to \operatorname{shape}(Q)$$
 and  $F: \prod_{i \in \operatorname{shape}(P)} (Q_{f(i)} \to P_i)$ 

Reductions compose + Quotienting by  $\equiv_{W} \rightsquigarrow \mathbf{Weihrauch\ degrees}$ 

## The more general picture: container morphisms

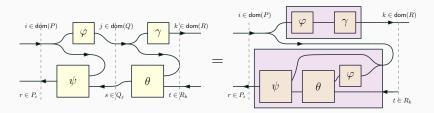

- Fix a category C with **pullbacks**
- Cont(C) has internal families in C as objects

#### Official definition

A morphism  $P \to Q$  in  $Cont(\mathcal{C})$  is  $\underline{\mathbf{a}}$  pair (f, F) of

$$f: \operatorname{shape}(P) \to \operatorname{shape}(Q)$$
 and  $F: \prod_{i \in \operatorname{shape}(P)} (Q_{f(i)} \to P_i)$ 

(To make sense of what F is: requires pullbacks)

A Weihrauch reduction  $P \leq_{\mathbf{W}} Q = \text{morphism } P \to Q \text{ in } \mathsf{Cont}(\mathsf{ReprSp})$ 

# Some functors on containers/Weihrauch problems

• Coproducts (joins) +:

$$\operatorname{shape}(P+Q) \cong \operatorname{shape}(P) + \operatorname{shape}(Q) \qquad \begin{array}{rcl} (P+Q)_{\operatorname{\mathsf{in}}_1(i)} & = & P_i \\ (P+Q)_{\operatorname{\mathsf{in}}_2(j)} & = & Q_j \end{array}$$

• Cartesian product  $\times$ : "given inputs for both, solve one"  $\operatorname{shape}(P \times Q) \cong \operatorname{shape}(P) \times \operatorname{shape}(Q) \quad (P \times Q)_{i,j} = P_i + Q_j$ 

Parallel product ⊗: "solve both problems"
 shape(P ⊗ Q) ≅ shape(P) × shape(Q) (P ⊗ Q)<sub>i,j</sub> = P<sub>i</sub> × Q<sub>j</sub>

• I: shape(I) = positions(I) = 1

# Composition, iterated composition

## Sequential composition $Q \triangleright P$

- Implicitly: ability to make an oracle call to Q then P
- Explicitly: given an instance i of Q and a function that takes a solution of i to an instance of P, compute all relevant solutions

$$\begin{array}{ccc} \operatorname{shape}(Q \triangleright P) & \cong & \sum\limits_{i \in \operatorname{shape}(Q)} \left(Q_i \to \operatorname{shape}(P)\right) \\ (Q \triangleright P)_{i,f} & \cong & \sum\limits_{r \in Q_i} P_{f(r)} \end{array}$$

#### Iterated composition $P^{\triangleright}$

- Explicitly: computed as the least fixpoint of  $X \mapsto \mathbf{I} + (P \triangleright X)$
- ullet Implicitly: ability to make a finite but not fixed in advance number of oracle calls to P

# Fixpoint of operators

least fixpoint	initial algebra	$\mu$
greatest fixpoint	terminal coalgebra	ν

#### A very plausible conjecture (Folklore?)

If F is a fibred polynomial endofunctor over containers, the following exists:

- an initial algebra  $\mu F$  for F
- a terminal coalgebra  $\nu F$  for F
- a somewhat canonical bialgebra  $\zeta F$  sitting in-between

#### Examples:

- $P^{\triangleright} = \mu(X \mapsto \mathbf{I} + P \triangleright X)$
- $P^{\otimes} = \mu(X \mapsto \mathbf{I} + X \otimes P)$
- $P^{\otimes \infty} = \zeta(X \mapsto X \otimes P)$
- $P^{\triangleright \infty} = \zeta(X \mapsto P \triangleright X)$

## Equational theory of the Weihrauch lattice

- The Weihrauch degrees are a distributive lattice.
- Every countable distributive lattice embeds into  $(\mathfrak{W}, +, \times)$  (via the Medvedev degrees)
- Thus,  $(\mathfrak{W}, +, \times) \models t \leq u$  iff  $t \leq u$  is provable from the axioms of distributive lattices. (formulas being implicitly universally quantified)

#### **Driving question**

Can we extend this to additional operations? In particular:

- Can we axiomatize equation in those extensions?
- What is the complexity of deciding universal validity of  $t \leq u$ ?

## Equational theory of the Weihrauch lattice

- The Weihrauch degrees are a distributive lattice.
- Every countable distributive lattice embeds into  $(\mathfrak{W}, +, \times)$  (via the Medvedev degrees)
- Thus,  $(\mathfrak{W}, +, \times) \models t \leq u$  iff  $t \leq u$  is provable from the axioms of distributive lattices. (formulas being implicitly universally quantified)

#### **Driving question**

Can we extend this to additional operations? In particular:

- Can we axiomatize equation in those extensions?
- What is the complexity of deciding universal validity of  $t \leq u$ ?

#### Meta-question

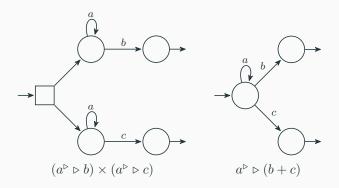

For a given signature, is there anything true in the Weihrauch degree that is not true for all (suitable) categories of containers?

## Terms with composition and automata

## Starting observation

Terms over  $0, \mathbf{I}, +, \triangleright, (-)^{\triangleright} = \text{can}$  be regarded as regular expressions. (alphabet = the set of variables)

- Terms can be mapped to NFAs in a meaningful way
- Adding  $\times$  = allowing alternating automata

## Universal validity and games

Given alternating automata  $\mathcal{A}$  and  $\mathcal{B}$ , we can define a game  $\mathcal{D}(\mathcal{A}, \mathcal{B})$  that captures a notion of simulation such that

#### Theorem

$$(\mathfrak{W}, +, \times, \triangleright, (-)^{\triangleright}) \models t \leq u \text{ iff Duplicator wins in } \partial(\mathcal{A}_t, \mathcal{A}_u).$$

Some properties of  $\mathfrak{d}(\mathcal{A},\mathcal{B})$ :

- this is a Büchi game
- allows to make several attempts at simulating  ${\mathcal A}$  in parallel

(using  $\mathcal{B}$  exactly once)

## Universal validity and games

Given alternating automata  $\mathcal{A}$  and  $\mathcal{B}$ , we can define a game  $\mathcal{D}(\mathcal{A}, \mathcal{B})$  that captures a notion of simulation such that

#### Theorem

$$(\mathfrak{W}, +, \times, \triangleright, (-)^{\triangleright}) \models t \leq u \text{ iff Duplicator wins in } \partial(\mathcal{A}_t, \mathcal{A}_u).$$

Some properties of  $\mathfrak{d}(\mathcal{A},\mathcal{B})$ :

- this is a Büchi game
- allows to make several attempts at simulating  $\mathcal{A}$  in parallel (using  $\mathcal{B}$  exactly once)

$$\Rightarrow \mathcal{O}(|\mathcal{B}|2^{|\mathcal{A}|})$$
 positions

## Universal validity and games

Given alternating automata  $\mathcal{A}$  and  $\mathcal{B}$ , we can define a game  $\partial(\mathcal{A}, \mathcal{B})$  that captures a notion of simulation such that

#### Theorem

$$(\mathfrak{W}, +, \times, \triangleright, (-)^{\triangleright}) \models t \leq u \text{ iff Duplicator wins in } \partial(\mathcal{A}_t, \mathcal{A}_u).$$

Some properties of  $\partial(\mathcal{A}, \mathcal{B})$ :

- this is a Büchi game
- allows to make several attempts at simulating  $\mathcal{A}$  in parallel (using  $\mathcal{B}$  exactly once)

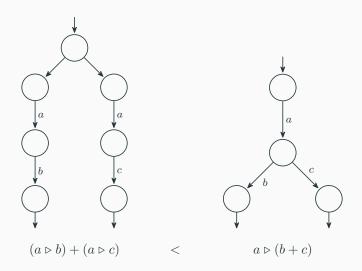

$$\Rightarrow \mathcal{O}(|\mathcal{B}|2^{|\mathcal{A}|})$$
 positions

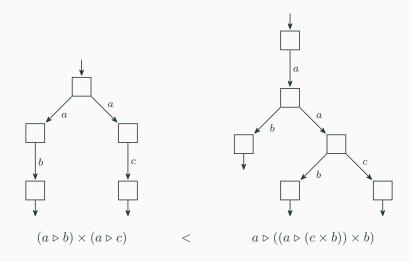

#### Corollary

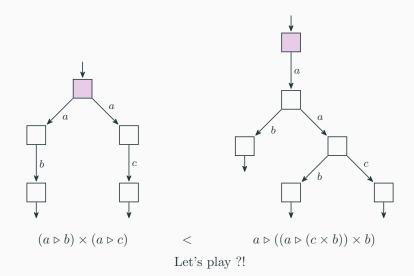

"
$$(\mathfrak{W}, \mathbf{I}, 0, +, \times, \triangleright, (-)^{\triangleright}) \models t \leq u$$
?" is decidable.

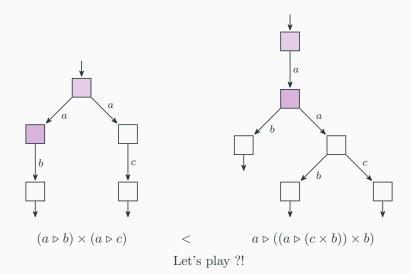

• Conjecture: this is PSPACE-complete.

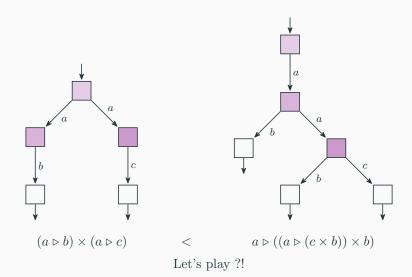

# A simple example of simulation and non-simulation

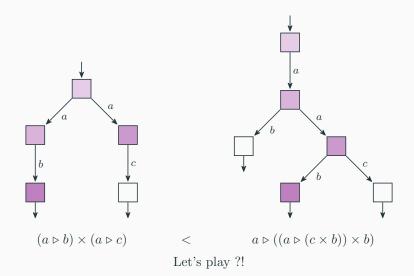

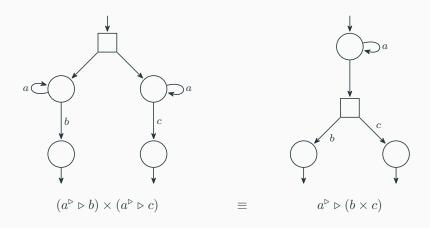

## Non-trivial useful axiom for fixpoints (Westrick, 2021)

The following is valid in the Weihrauch degrees

$$x \triangleright x \le x \qquad \Rightarrow \qquad x^{\triangleright} \le x$$

## Non-trivial useful axiom for fixpoints (Westrick, 2021)

The following is valid in the Weihrauch degrees

$$x \triangleright x \le x \qquad \Rightarrow \qquad x^{\triangleright} \le x$$

• Similar: an axiom of left-handed Kleene algebras (LKA)

$$y \triangleright x \le x \qquad \Rightarrow \qquad y^{\triangleright} \triangleright x \le x$$

#### Non-trivial useful axiom for fixpoints (Westrick, 2021)

The following is valid in the Weihrauch degrees

$$x \triangleright x \le x \qquad \Rightarrow \qquad x^{\triangleright} \le x$$

• Similar: an axiom of left-handed Kleene algebras (LKA)

$$y \triangleright x \le x \qquad \Rightarrow \qquad y^{\triangleright} \triangleright x \le x$$

 $\bullet$  For  $\times$ , it seems like we sometimes need

$$(y \triangleright x) \times z \le x \qquad \Rightarrow \qquad (y^{\triangleright} \triangleright x) \times z \le x$$

(key example:  $\mathbf{I} \leq a \times b$  implies  $a^{\triangleright} \times b^{\triangleright} \leq (a \times b)^{\triangleright}$ )

#### Non-trivial useful axiom for fixpoints (Westrick, 2021)

The following is valid in the Weihrauch degrees

$$x \triangleright x \le x \qquad \Rightarrow \qquad x^{\triangleright} \le x$$

• Similar: an axiom of left-handed Kleene algebras (LKA)

$$y \triangleright x \le x \qquad \Rightarrow \qquad y^{\triangleright} \triangleright x \le x$$

 $\bullet$  For  $\times$ , it seems like we sometimes need

$$(y \rhd x) \times z \leq x \qquad \Rightarrow \qquad (y^{\rhd} \rhd x) \times z \leq x$$

(key example: 
$$\mathbf{I} \leq a \times b$$
 implies  $a^{\triangleright} \times b^{\triangleright} \leq (a \times b)^{\triangleright}$ )

#### **Theorem**

The above axioms are valid in the extended Weihrauch degrees.

Candidate axiomatization of inequations

 $\bullet$  All the axioms of LKA w/o right-distributivity of + over  $\star$ 

Candidate axiomatization of inequations

- All the axioms of LKA w/o right-distributivity of + over  $\star$ 
  - i.e. it can be the case that  $R \triangleright (P+Q) \not\equiv_{\mathcal{W}} (R \triangleright P) + (R \triangleright Q)$

#### Candidate axiomatization of inequations

- All the axioms of LKA w/o right-distributivity of + over  $\star$ 
  - i.e. it can be the case that  $R \triangleright (P+Q) \not\equiv_{\mathcal{W}} (R \triangleright P) + (R \triangleright Q)$
  - why: LKA = language inclusions, but we want simulations

#### Candidate axiomatization of inequations

- All the axioms of LKA w/o right-distributivity of + over  $\star$ 
  - i.e. it can be the case that  $R \triangleright (P+Q) \not\equiv_{\mathbf{W}} (R \triangleright P) + (R \triangleright Q)$
  - why: LKA = language inclusions, but we want simulations
- The distributive lattice axioms with units +

$$\begin{array}{cccc} (y \rhd x) \times (z \rhd x) & \leq & (y \times z) \rhd x \\ & (y \rhd x) \times z & \leq & y \rhd (x \times z) \\ & (y \rhd x) \times z \leq x & \Rightarrow & (y^{\triangleright} \rhd x) \times z \leq x \\ & 1 \rhd x = 1 & 0 \rhd x = 0 \end{array}$$

#### Candidate axiomatization of inequations

- All the axioms of LKA w/o right-distributivity of + over  $\star$ 
  - i.e. it can be the case that  $R \triangleright (P+Q) \not\equiv_{\mathbf{W}} (R \triangleright P) + (R \triangleright Q)$
  - why: LKA = language inclusions, but we want simulations
- The distributive lattice axioms with units +

$$\begin{array}{cccc} (y \rhd x) \times (z \rhd x) & \leq & (y \times z) \rhd x \\ & (y \rhd x) \times z & \leq & y \rhd (x \times z) \\ & (y \rhd x) \times z \leq x & \Rightarrow & (y^{\rhd} \rhd x) \times z \leq x \\ & 1 \rhd x = 1 & 0 \rhd x = 0 \end{array}$$

#### Theorem

Complete for the equational theory of  $(\mathfrak{W}, \mathbf{I}, 0, 1, +, \times, \triangleright, (-)^{\triangleright})$ .

Candidate axiomatization of inequations

- All the axioms of LKA w/o right-distributivity of + over  $\star$ 
  - i.e. it can be the case that  $R \triangleright (P+Q) \not\equiv_{\mathrm{W}} (R \triangleright P) + (R \triangleright Q)$
  - why: LKA = language inclusions, but we want simulations
- The distributive lattice axioms with units +

$$\begin{array}{cccc} (y \rhd x) \times (z \rhd x) & \leq & (y \times z) \rhd x \\ & (y \rhd x) \times z & \leq & y \rhd (x \times z) \\ & (y \rhd x) \times z \leq x & \Rightarrow & (y^{\rhd} \rhd x) \times z \leq x \\ & 1 \rhd x = 1 & 0 \rhd x = 0 \end{array}$$

#### Theorem

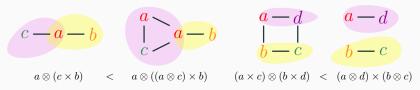

Complete for the equational theory of  $(\mathfrak{W}, \mathbf{I}, 0, 1, +, \times, \triangleright, (-)^{\triangleright})$ .

Proof idea: ∃ positional simulation strategies, induction on the syntax

# How this started: the theory of $\otimes$ , $\times$

#### A notion of combinatorial reduction between graphs

A reduction from  $(V_0, E_0, c_0)$  to  $(V_1, E_1, c_1)$  is a colour-preserving function  $h: V_1 \to V_0$  such that the image of any maximal clique in  $(V_1, E_1)$  under h contains a maximal clique in  $(V_0, E_0)$ .

## Combinatorial characterization (Neumann, Pauly, P.)

 $(\mathfrak{W}, \times, \otimes) \models t \leq u$  iff there is a reduction from  $G_t$  to  $G_u$ . As a result, deciding  $(\mathfrak{W}, \times, \otimes) \models t \leq u$  is  $\Sigma_2^p$ -complete.

- Axiomatizing: harder!
- +,  $\triangleright$  and  $\otimes$ : opens the gates of hell (**concurrency theory**)

# (and related mess)

Conjectures!

## Extending the signature/the simulation game

- Enriching the signature with aforementioned  $\mu =$  same thing with all finite alternating automata
- Then enriching the signature with  $\nu=$  parity alternating automata
- Then enriching the signature with  $\zeta$  (or  $(-)^{\triangleright \infty}$ ) = runs of countable ordinal length
- Enriching with  $\otimes$  = going to higher-dimensional automata
  - Dealing with stuff that sounds like concurrency
  - Scarier to me!

## Some englobing syntax for all signatures discussed here

$$\frac{x \in \Gamma \cup \Delta}{\Gamma; \Delta \vdash x} \qquad \frac{\Gamma; \Delta \vdash t \qquad \Gamma; \Delta \vdash u \qquad \Box \in \{\otimes, \times, +\}}{\Gamma; \Delta \vdash t \Box u}$$

$$\frac{\Gamma; \Delta \vdash t \qquad \frac{\Gamma; \Delta \vdash t \qquad \Gamma; \Delta \vdash u}{\Gamma; \Delta \vdash t \rhd u}}{\Gamma; \Delta \vdash t \rhd u}$$

$$\frac{\Gamma; \Delta \vdash t \qquad \Gamma; \cdot \vdash u \qquad \xrightarrow{*} \in \{\multimap, \Rightarrow\}}{\Gamma; \Delta \vdash t \Rightarrow u}$$

$$\frac{\Gamma; \Delta \vdash t \qquad \uparrow; \cdot \vdash u \qquad \xrightarrow{*} \in \{\multimap, \Rightarrow\}}{\Gamma; \Delta \vdash t \Rightarrow u}$$

## Another kind of questions

## Conjecture(s)

For various signatures, true inequations in the slightly extended Weihrauch degrees are true in all categories of containers.

- Proofs of completeness = there exists messy enough problems to not create other true equations in Weihrauch degrees.
- $\bullet$  When does that happen in a category  ${\cal C}$

#### Conjecture: that's true when

For every  $n \in \mathbb{N}$ , there is

- an object A in C
- a strong antichain of (regular?) subobjects  $(V_i)_{i < n}$  of A
- with all  $V_i \cup V_j$  are connected

## Meta-question: motivations?

Would anyone care about similar results for other categories of containers?

## A vaguer project

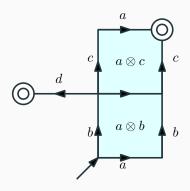

#### Inconvenient truths

- Weihrauch problems are the containers over **regular projective** represented spaces (subspaces of  $\mathbb{N}^{\mathbb{N}}$ ) for which every question has an answer
- Containers over subspaces of Baire space are only **weakly** locally cartesian closed
- (and also have only weak (co)inductive types)
- It sounds unproblematic in practice because
  - The weak structure is good enough
  - (a systematic way of relating that = this is the category of regular projectives of represented spaces, which is a nice lccc)

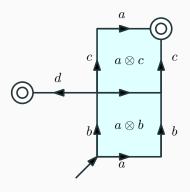

## Question(s)

How do we transfer cleanly results about containers on a nice category  $\mathcal{C}$  with enough projectives to containers of the full subcategory of projectives?

# Example of what's a higher-dimensional automaton

## Example of what's a higher-dimensional automaton

(I dislike this HDA, I feel it is not nice enough to interpret in containers)
